

ABSTRACT

Entertainment system main body is connected via a relay device to an “i-mode” portable telephone system using a controller connection connector or external memory insertion connector provided on entertainment system main body. This relay device has
5 the function of coordinating the software and hardware of the entertainment system and the portable telephone system. Entertainment system main body connected to an i-mode portable telephone system makes it possible, using existing infrastructure and with no major design changes, to effect the purchase, exchange, and interaction, etc. of game data using an online service that the i-mode portable telephone system has, such as site
10 connection service, i-mode mail, and Internet connection.
